Thant Hein Thwin

Staff Software Engineer | AI-Native, TypeScript, Python & AWS

Bangkok, Thailand (open to relocation) | thantheinthwin.dev@gmail.com | +66 63 106 8545 | linkedin.com/in/thanthein | github.com/thantheinthwin | thantheinthwin.vercel.app

PROFESSIONAL SUMMARY

Full-stack engineer with **over 5 years** building production web, mobile, and AI platforms. At Six Atomic, I owned the **Garment Generation Agentic Engine** and led the harness that ran multiple AI agents in production, using TDD, SOLID patterns, and evaluation graders to direct coding agents. I also cut AI cost **by 70%** and halved response time, and mentored senior engineers on AI-assisted development. Works across TypeScript, React, Node.js, Python, Golang, PostgreSQL, and AWS.

CORE SKILLS

AI Engineering: Claude Code, OpenAI Codex, AI agent orchestration, LLM integration, RAG, vector search

Languages & Frameworks: TypeScript, React.js, Node.js, Python, Golang, Next.js, React Native, JavaScript, HTML, CSS, Express.js, Java, C#, C

Tools & Practices: TDD, CI/CD, Git, SOLID, code review

Data & Infrastructure: PostgreSQL, AWS, Docker, MySQL, OracleDB, MongoDB, Redis, Kafka, ElasticSearch, GORM, Mongoose, Prisma

Observability & Testing: Grafana, Prometheus, Loki, Sentry, Jest, Coolify

APIs & Real-Time: REST, GraphQL, gRPC, WebSocket, Firebase, Supabase

Product Analytics: Google Analytics, Microsoft Clarity, PostHog

PROFESSIONAL EXPERIENCE

Lead Algorithm Engineer, Six Atomic

2025 – 2026

- Led the AI orchestration platform as **harness engineer**: built the model harness through **OpenRouter**, set up **evaluations and graders** to score the orchestrator's behavior and performance, and built validation frameworks, CI/CD pipelines, and deployment strategies to run multiple AI agents in production without drift.
- Wrote **TDD** test suites and used SOLID design patterns to direct coding agents, shipping features autonomously while holding quality up under fast delivery timelines, and **mentored senior engineers** on AI-assisted development.
- Used evaluation scores and graders to guide optimization instead of using AI blindly: cut AI cost **by 70%** on very large data processing and **halved response time** with **RAG-like chunking** of user input and better scaling.
- Owned the **Garment Generation Agentic Engine**, one of three core platform pillars. Built an end-to-end generative design system that cut pattern creation time **from 2–4 weeks to 5 minutes**, ramping up in 3 months after moving from full-stack web into a math-heavy fashion domain.
- Applied **DevOps and system architecture** knowledge to study how the whole system fit together, then designed solutions that improved AI orchestration performance and cost.
- Built mods and improved **developer experience** through **loop engineering and graph engineering**, going beyond plain prompting.

Tech Stack: Python, TypeScript, OpenRouter, AWS, Docker

Senior Full Stack Engineer, Empire Pixel

2024 – 2025 | Remote

- Led **architecture decisions and code reviews**, and set the team's clean-code and cross-platform development standards.
- Built a **RAG-powered content automation platform**, combining multiple LLMs (StormGPT, ChatGPT, Gemini) with

vector search. Increased AI-driven output **by 700%** and cut cost **from $1,000 to $5 per 100 posts**.

- Set up **monitoring and logging** (Grafana, Prometheus, Loki, Docker) across distributed services, making issues easier to catch and debug, and improving Core Web Vitals and SEO.
- Built a cross-platform mobile app with a web-to-native bridge and unified Android/iOS payments, while scaling the backend to serve **800+ dynamic pages** off a single VPS.

Tech Stack: React, React Native, Next.js, TypeScript, Node.js, PayloadCMS, Redis, Docker, AWS/GCP, Grafana, Payment APIs

Mid Level Fullstack Software Engineer, BigBee

2021 – 2024 | Yangon, Myanmar

- Evaluated and adopted new technologies to keep the stack current and improve system architecture.
- Built **Golang middlewares**, request pipelines, and context handling to strengthen backend workflows.
- Improved app speed using **SSR, hydration, caching, and rendering strategies** in Next.js and React.
- Built reusable, headless components for a scalable frontend architecture, applying design patterns, OOP, and clean-code principles.
- Managed complex client-side state with RxJS and built Redis-backed data pipelines and caching.

Tech Stack: React, Next.js, React Native, TypeScript, RxJS, React Query, React Hook Form, TanStack Table, Expo, Golang, PostgreSQL, Redis, Hasura, Docker

EDUCATION

Bachelor's Degree with Honors in Computing, University of Greenwich

12/2023 – 02/2025 | Greenwich, United Kingdom

Diploma in Electronic Communication and Engineering, Myanmar Institute of Information Technology

12/2017 – 05/2020 | Mandalay, Myanmar

LANGUAGES

English: IELTS Band Score 7.5 | Burmese: Native | Deutsch (German): A2
